

NARRATIX: THE COUNTERFACTUALS

A signal layer for the narrative economy.

What is Narratix?

A closed system that tracks high-velocity, market-moving narratives before they reflect in price. No dashboards. No threads. Just divergence detection from noise to move.

Why narratives?

Because markets no longer move on fundamentals — they move on attention. Narratix isolates emergent stories that accelerate belief ahead of price.

What makes it different?

Not sentiment — narrative velocity
Not keywords — contextual clusters
Not charts — divergence signals
It doesn't follow the market. It preempts it.

Who's it for?

Traders and teams who trade attention, not lag.
The kind who already know what this is — or don't need to ask.

Is this open?

No.
Narratix is not community software. It's an edge.
Closed source. Closed access. Visible only to those paying attention.

What powers it?

Ingestion across news, social, transcripts, filings
Clustering via LLMs and entity graphs
Signal scoring via divergence curves and spread path models
(That's as much as we're saying here.)

Why is it under HomeCloudHQ?

Narratix runs on sovereign compute.
The logic layer proves the infra: local, real-time, silent.
No cloud. No compromise.

Will I get access?

Not by asking.
Maybe by building.
Maybe by being watched back.

No product page. No hype. Just one doc.

If this is enough for you — it's already too much for most.
